

Data Privacy Requests - Intake and verification

Owner: Privacy Operations | **Audience:** All support staff | **Version:** 1.0

Scope. Requests to export, correct, restrict, or delete personal data must be routed to Privacy Operations. This includes requests mentioning GDPR, data protection, account deletion, personal-data access, or retention.

Intake. Record the request accurately and verify the requester through the approved process before discussing account data. Include the requester relationship, workspace context, requested action, and the date received in the internal escalation note.

Data minimization. Do not ask a customer to provide unnecessary personal data in the ticket. Do not request identity documents, passwords, or copies of personal records unless the approved Privacy Operations process explicitly requires them.

Routing rule. A privacy request is never a standard troubleshooting ticket, even when it also contains a product question. Route the request first; Privacy Operations determines the applicable process and required response.

Data Privacy Requests - Communication boundary

Actions support must not take. Do not confirm deletion, disclose personal data, provide retention commitments, or state a legal conclusion in a standard reply. Privacy Operations determines the applicable process and confirms any final outcome.

Permitted acknowledgement. If an acknowledgement is appropriate, use the approved template to confirm receipt and state only that the request has been forwarded for review. Do not promise completion dates, specific legal rights, or a particular outcome.

Escalation note checklist. Include the exact request, any stated deadline, requester details already present in Zendesk, workspace context, and whether the ticket contains other urgent support issues. Preserve the ticket and internal notes as part of the audit trail.

FAQ. A request to delete an account is sensitive even when the customer asks politely and the identity is known. A customer asking how to change their display name is not automatically a privacy escalation unless they explicitly request a data-rights action.
